Abstract. *Alocasia puncakborneensis* is described and illustrated as a new species of the *Alocasia* Princeps Complex from upper hill forest on the extremely hard Paleogene sandstones of the Penrissen range, SW Sarawak. *Alocasia puncakborneensis* occurs at the highest altitude of any of the locally-restricted /geologically obligated species yet described for the Princeps Complex.

Keywords: *Alocasia* Princeps Complex, Sarawak, Penrissen Range.

INTRODUCTION

*Alocasia* Schott was last revised for Borneo by Hay (1998), recognizing 20 species of which eight were then described as new, while one probable novelty was left as incompletely known. Since then the incompletely known species was described (Hay 2000), and four entirely new species have been published (Boyce 2007; Kurniawan and Boyce 2011; Wong and Boyce 2016). Presently the *Alocasia* flora for Borneo stands at 24 described species, of which three – *Alocasia longiloba* Miq., *A. princeps* W.Bull, and *A. scabriuscula* N.E.Br. are largely each treated as taxonomically intractable species complexes, with the *A. princeps* and *A. scabriuscula* complexes seemingly related and treated by Hay (1998) together as forming the *A. scariuscula* Group. During the course of fieldwork since 2004 the authors have become aware of at least a further 10 undescribed *Alocasia* species occurring on Borneo but in many instances have yet to encounter the plants in a condition suitable to permit description while herbarium material, where it exists, is wholly inadequate. Occasionally, however, we encounter a new species flowering in habitat permitting formal description.

Here we describe one such novelty occurring on the extremely hard Paleogene sandstones of the Penrissen Range of SW Sarawak where it is
restricted to moist upper hill forest above 800 m. Geological occurrences in this paper are verified with Tate (2001).

**Alocasia puncakborneensis** S.Y.Wong & P.C.Boyce, sp. nov.

Type: Malaysian Borneo, Sarawak, Kuching, Padawan, Puncak Borneo, trail to Batu Panggah, 1°07’37.0”N 110°13’47.5”E, 838 m asl. 15 May 2019, Wong Sin Yeng & P. C. Boyce AL- 80 (holotype SAR!; isotype KEP!). (Figures 1 & 2).

**Diagnosis**

*Alocasia puncakborneensis* falls uncontroversially in the *Alocasia* Princeps Complex by the thinly leathery leaves, sequentially produced blooms not interspersed with foliage leaves, the staminate portion of the spadix partially enclosed within the lower spathe chamber, and the acroscopic pistils. *Alocasia puncakborneensis* is distinguished from all described species of the complex by the brilliant green leaf blades with the tertiary veins forming a prominently raised fine reticulum on the adaxial surface.

**Description**

Small herb to ca 55 cm tall; rhizome initially condensed, erect, later elongating and decumbent, ca 3 cm diam.; leaves several together, irregularly interspersed with foliage leaves, the staminate portion of the spadix partially enclosed within the lower spathe chamber, and the acroscopic pistils. *Alocasia puncakborneensis* is distinguished from all described species of the complex by the brilliant green leaf blades with the tertiary veins forming a prominently raised fine reticulum on the adaxial surface.

**Etymology**

The specific epithet is from the Type locality plus the suffix -ensis, indicating ‘from’. Puncak (summit of a mountain in the Malay language) is pronounced pun-cha, with emphasis on the second syllable.

**Distribution**

Occurring as localised small populations and occasional individuals throughout the higher reaches of the Penrissen Range, never below 800 m, and extending to about 1300 m asl.

**Ecology**

Terrestrial or facultatively lithophytic on steep shaded slopes or on damp boulders under moist upper hill forest on Paleogene sandstones, between 880–1170 m asl.

Figure 2. *Alocasia punctiformis* (A) Leaf blade with posterior lobes none peltate. (B) Leaf blade with peltate posterior lobes. Both unvouchered.
Notes

Alocasia puncakborneensis occurs at the highest altitude of any of the locally-restricted /geologically obligated species yet described for the Princeps Complex. Six of the eight hitherto known species are lowland species, exceptionally occurring up to 600 m asl, and mostly much lower, and are obligated to Karst limestone (Hay 1998). Three of these species occur in Sabah (Alocasia pangeran A.Hay, A. principiculus A.Hay, Alocasia puteri A.Hay), one in east Sarawak (A. venusta A.Hay), and two in SW Sarawak (A. reversa N.E.Br., A. ridleyi A.Hay). One of the remaining species, Alocasia wongii A.Hay, occurs across quite a wide area of east Sabah, usually at low altitudes on sandy sedimentary-derived substrates, although occasionally occurring on limestone. As currently defined Alocasia princeps W.Bull is widespread throughout middle and east Borneo at up to 1200 m asl, is ecologically highly inconstant, and morphologically rather variable. Detailed field studies will in all likelihood reveal the current concept to consist of more narrowly defined taxa (see Hay 1998 for more detailed discussion).

ACKNOWLEDGEMENTS

Fieldwork was most recently under Sarawak Forestry Department Permission to Conduct Research on Biological Resources – Permit No. (67) JHS/NCCD/600-7/2/107/Jld.2 and Park Permit No WL33/2019. The collaboration and support of the Sarawak Forestry Department and the Sarawak Biodiversity Centre are gratefully acknowledged. The last author extends his thanks to Tan Sri Datuk Amar Leonard Linggi Anak Jugah and Malesiana Tropicals Sdn Bhd for continued support and encouragement.
